

The Optimal Trade Entry (OTE) strategy, described by ICT, is one approach that traders can utilize to identify high-probability trade setups.

Market Structure

- 

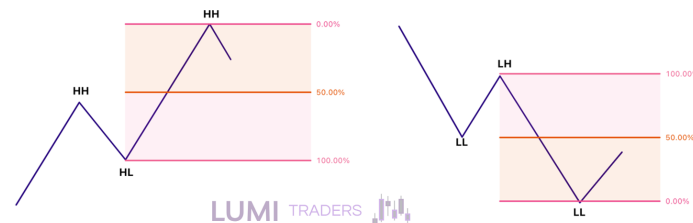

Figure 1 displays a comparison of the color calibration of the two monitors. The left monitor shows a color calibration chart with various color bars and their corresponding L*a*b* values. The right monitor shows a similar chart with color bars and their corresponding L*a*b* values. The color bars are arranged in a grid, and the L*a*b* values are listed next to each bar.

1. Determine the current market structure, whether it has a bullish or bearish bias.
This is crucial as Fibonacci levels work best within a trending market.
2. Identify significant swing highs and lows to draw the Fibonacci grid. These highs and lows are often visual prominent and easy to label.
3. Use the Fibonacci retracement tool to assess the correction potential in an uptrend (from bottom to top) or downtrend (from top to bottom).

The diagram illustrates the use of the Fibonacci retracement tool on price movement. It shows two price patterns: an uptrend from HL to HH and a subsequent retracement, and a downtrend from LH to LL and a subsequent retracement. Horizontal lines indicate retracement levels at 0.00%, 10.00%, 20.00%, 33.33%, 50.00%, 66.67%, and 100.00%.

Uptrend (HL to HH):

- 100.00% (44.12)
- 50.00% (45.09)
- 33.33% (44.21)
- 20.00% (43.59)
- 0.00% (48.77)

Downtrend (LH to LL):

- 100.00% (46.09)
- 50.00% (42.66)
- 33.33% (43.48)
- 20.00% (44.21)
- 0.00% (39.23)

Text on the right:

5. Use the Fibonacci retracement tool to a correction potential in an uptrend (from b or downtrend (from top to bottom).

1. Run a Fibonacci retracement tool from the highest high to the lowest low within the dealing range. This will help establish the overall range of price action.
2. Pay attention to areas where the algorithms consolidate. These consolidation areas indicate fair value and are important in determining the proper dealing range.
3. Consider the nearest high when the 50% Fibonacci level aligns with the common consolidation area. This will help identify the appropriate high point of the dealing range.
4. Select the lowest low as the low point of the dealing range. This ensures that the range encompasses the relevant price action and aligns with the areas where algorithms are active.

Wait for price to trade back into FVG and then reprice out of the FVG towards the targeted pool of liquidity.
Usually FVG lines up with 62% retracement level

OTE - Option #1

The chart displays a pink line graph with a blue shaded area labeled **MSS** and a green shaded area labeled **FVG+**. A blue eye icon is positioned over the FVG+ area. The y-axis has labels 0.00%, 82.00%, 70.50%, and 100.00%. A red target icon is in the top right corner.

OTE - Option #2
